Incident Analysis Report
Case: SOC250 - Palo Alto PAN-OS Command Injection

1. Executive Summary

A critical alert was identified involving a Command Injection vulnerability (CVE-2024-3400) targeting a Palo Alto Networks Firewall. The investigation confirmed that a malicious actor attempted to execute remote commands via a manipulated session cookie. Evidence of post-exploitation activity was found in the system logs, confirming a successful compromise.

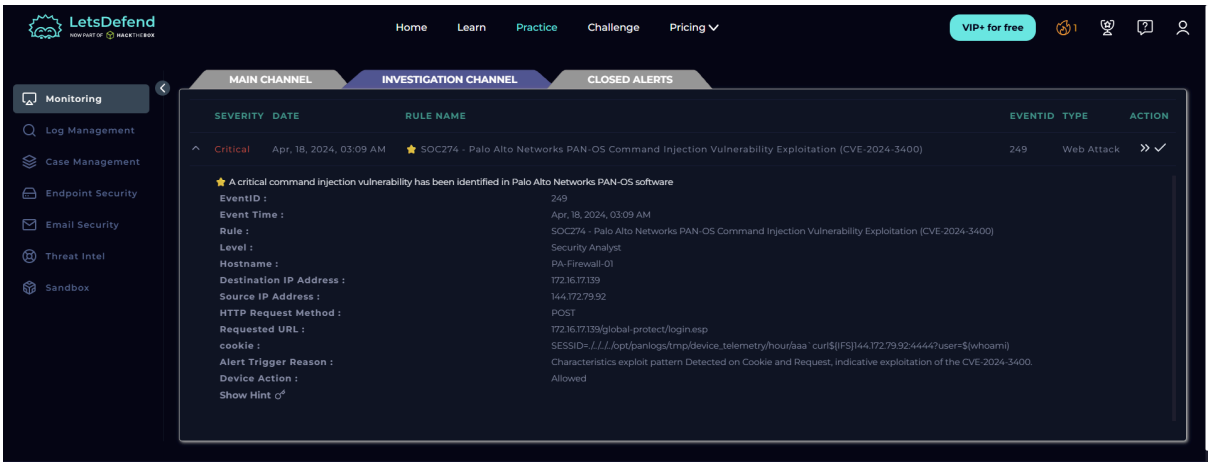
2. Incident Details

Detection Date April 15, 2026 (Simulated)
Vulnerability CVE-2024-3400 (PAN-OS Command Injection)
Affected Asset PA-Firewall-01 (172.16.17.139)
Attacker IP 144.172.79.92
Attack Vector Malicious HTTP Cookie Payload

3. Investigation Evidence

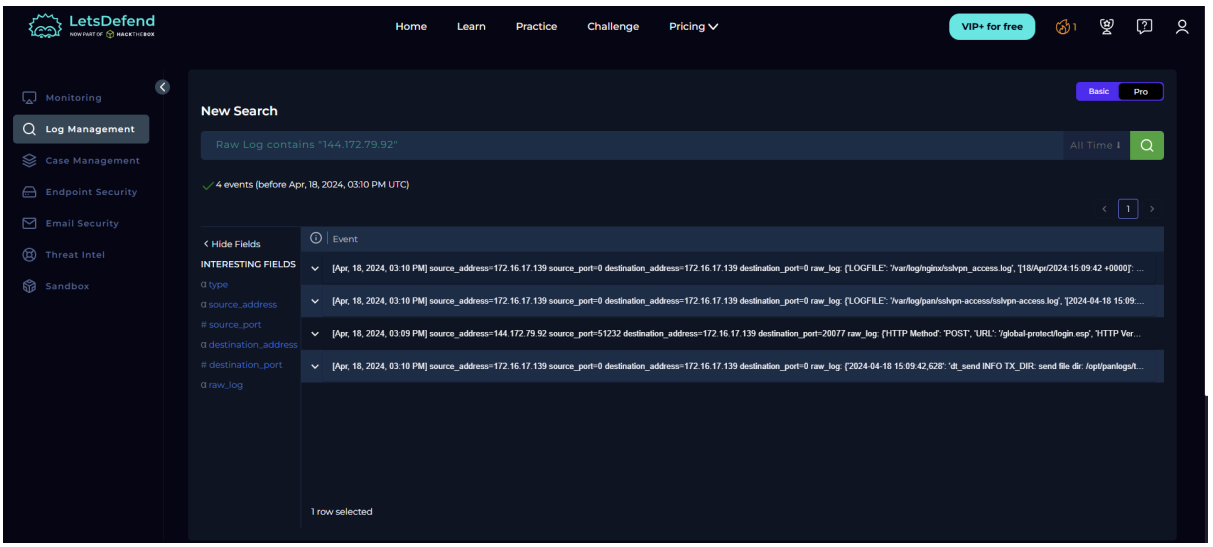
Step 1: Initial Alert Analysis

The SIEM triggered a high-severity alert. The payload contained a command injection string attempting to exfiltrate system identity via 'curl'.



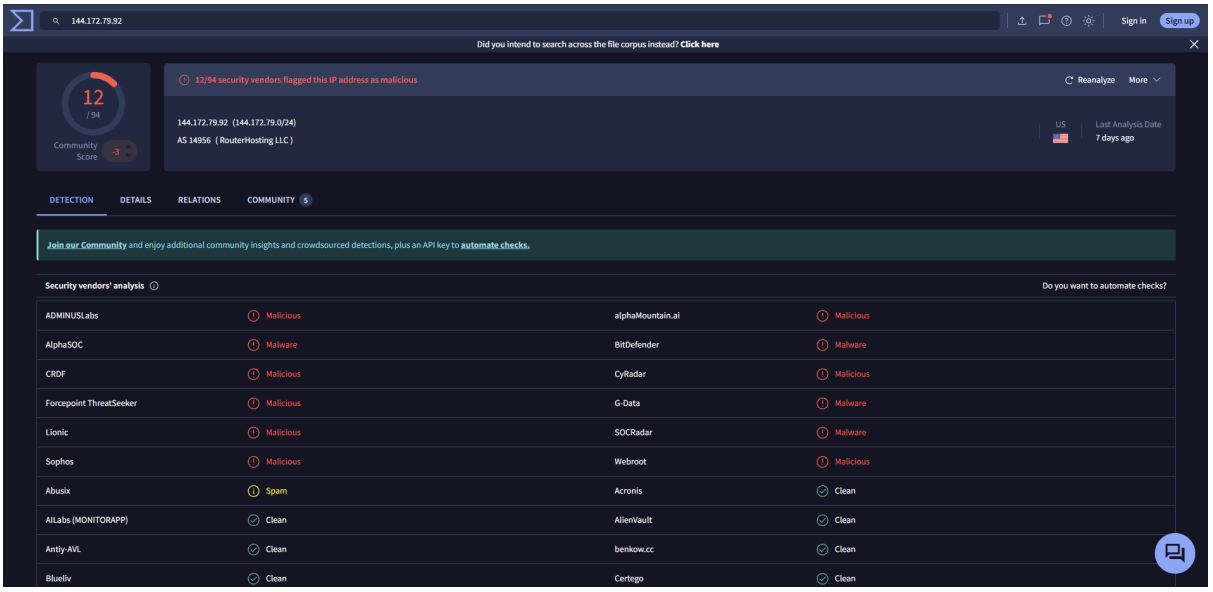
Step 2: Log Sequence Verification

Log analysis revealed system activity at 03:10 PM, exactly one minute after the initial attack, indicating the command was successfully processed by the OS.

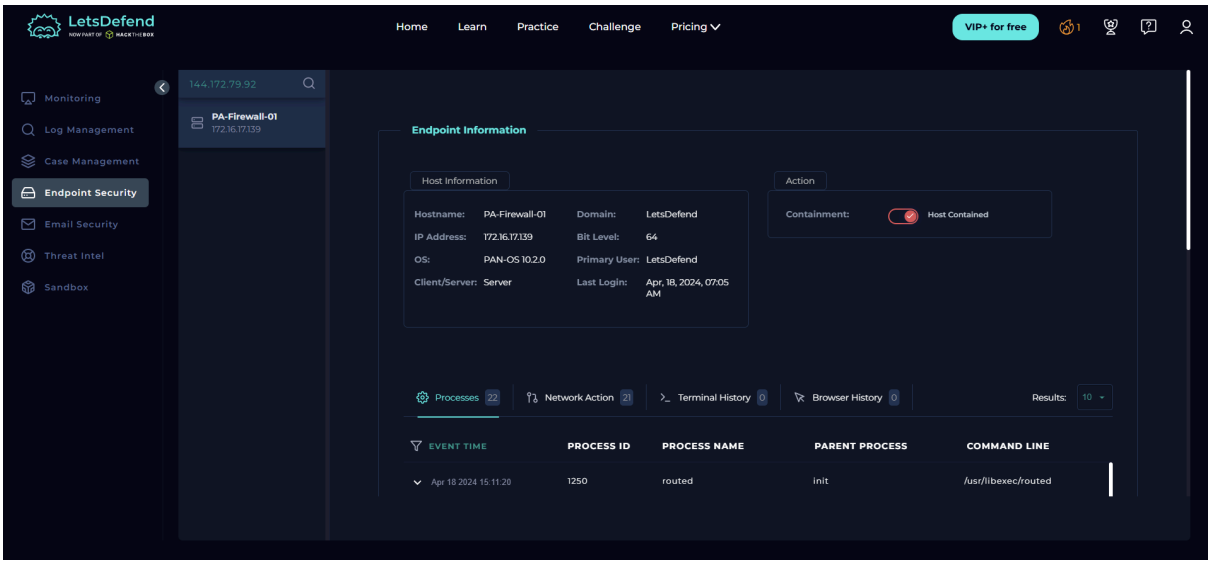


Step 3: External Intelligence (OSINT)

The Source IP was cross-referenced with threat intelligence databases, confirming its association with known malicious activity.



4. Conclusion & Response

VERDICT: TRUE POSITIVE - CRITICAL COMPROMISE


Actions Taken:
Verified the execution of unauthorized commands in the /opt/panlogs/ directory.
Recommended immediate isolation of PA-Firewall-01.
Triggered Incident Response protocols for credential rotation and patching.
